Database – No SQL – Mongodb

Session 2 –

1. **Open MongoDB shell and create a new database named insta_clone_db, then switch to it using the appropriate commands.**

Ans:

Create and switch to insta_clone_db:

Open the MongoDB shell:

Mongosh

Then create/switch to the database:

use insta_clone_db

Verify the current database:

Db

Expected output:

insta_clone_db

2. **Inside insta_clone_db, create a collection called posts that will store Instagram-style photo posts.**

Ans:

Create the posts collection:

db.createCollection("posts")

Expected output:

{ ok: 1 }

Verify:

show collections

Output:

Posts

3. **Create another collection named stories in insta_clone_db, and insert a sample story document with fields: username, image_url, and timestamp.**

Ans:

Create stories and insert a sample document

Create the collection:

```
db.createCollection("stories")
```

Insert a story:

```
db.stories.insertOne({
   username: "foodie_user",
   image_url: "https://example.com/story.jpg",
   timestamp: new Date()
})
```

Verify the document:

```
db.stories.find().pretty()
```

Example output:

```
{
  _id: ObjectId('...'),
  username: 'foodie_user',
  image_url: 'https://example.com/story.jpg',
  timestamp: ISODate('...')
}
```

Check both collections:

```
show collections
```

Expected:

posts

stories

4. **Drop the stories collection from insta_clone_db and verify that it no longer exists.

Hint: Use the drop() method on the collection and show the result with show collections.**

Ans: Drop the stories collection

Run:

db.stories.drop()

Expected result:

True

Now verify that stories is gone:

show collections

Expected output:

Posts

5. **Drop the entire insta_clone_db database from MongoDB, then use the show dbs command to confirm it has been deleted.**

Ans:

First make sure you are still using the correct database:
use insta_clone_db

Drop the database:

db.dropDatabase()

Expected result:

{ ok: 1, dropped: 'insta_clone_db' }

Finally, check the available databases:

show dbs
